SQL Cheat Sheet: Accessing Databases using Python

SQLite

Topic	Syntax	Description	Example
connect() cursor()	<pre>sqlite3.connect() con.cursor()</pre>	Create a new database and open a database connection to allow sqlite3 to work with it. Call sqlite3.connect() to create a connection to the database INSTRUCTOR.db in the current working directory, implicitly creating it if it does not exist. To execute SQL statements and fetch results from SQL queries, use a database cursor. Call con.cursor() to create the	<pre>1. 1 2. 2 1. import sqlite3 2. con = sqlite3.connect("INSTRUCTOR.db") Copied! 1. 1 1. cursor_obj = con.cursor() Copied!</pre>
execute()	cursor_obj.execute()	Cursor. The execute method in Python's SQLite library allows to perform SQL commands, including retrieving data from a table using a query like "Select * from table_name." When you execute this command, the result is obtained as a collection of table data stored in an object, typically in the form of a list of lists.	<pre>1. 1 1. cursor_obj.execute('''insert into INSTRUCTOR values (1, 'Rav', 'Ahuja', 'TC Copied!</pre>
fetchall()	cursor_obj.fetchall()	The fetchall() method in Python retrieves all the rows from the result set of a query and presents them as a list of tuples.	<pre>1. 1 2. 2 3. 3 4. 4 5. 5 1. statement = '''SELECT * FROM INSTRUCTOR''' 2. cursor_obj.execute(statement) 3. output_all = cursor_obj.fetchall() 4. for row_all in output_all: 5. print(row_all)</pre>
fetchmany()	cursor_obj.fetchmany()	The fetchmany() method retrieves the subsequent group of rows from the result set of a query rather than just a single row. To fetch a few rows from the table, use fetchmany(numberofrows) and mention how many rows you want to fetch.	Copied! 1. 1 2. 2 3. 3 4. 4 5. 5 1. statement = '''SELECT * FROM INSTRUCTOR''' 2. cursor_obj.execute(statement) 3. output_many = cursor_obj.fetchmany(2) 4. for row_many in output_many: 5. print(row_many) Copied!
read_sql_query()read_sql_query()	read_sql_query() is a function provided by the Pandas library in Python, and it is not specific to MySQL. It is a generic function used for executing SQL queries on various database systems, including MySQL, and retrieving the results as a Pandas DataFrame.	<pre>1. 1 1. df = pd.read_sql_query("select * from instructor;", conn) Copied!</pre>
shape	dataframe.shape	It provides a tuple indicating the shape of a DataFrame or Series, represented as (number of rows, number of columns).	1. 1 1. df.shape Copied!
close()	con.close()	con.close() is a method used to close the connection to a MySQL database. When called, it terminates the connection, releasing any associated resources and ensuring the connection is no longer active. This is important	1. 1 1. con.close() Copied!

CREATE TABLE	CREATE TABLE table_name (column1 datatype constraints, column2 datatype constraints,);	or managing database onnections efficiently nd preventing resource eaks in your MySQL atabase interactions. The CREATE TABLE tatement is used to define nd create a new table vithin a database. It e structure of its e structure of its olumns (including data ypes and constraints), and ny additional properties uch as indexes. This tatement essentially sets p the blueprint for rganizing and storing ata in a structured format Copied!
barplot()	seaborn.barplot(x="x- axis_variable", y="y- axis_variable", data=data)	<pre>eaborn.barplot() is a unction in the Seaborn ython data visualization brary used to create a bar lot, also known as a bar sed to display the elationship between a ategorical variable and a copied! umeric variable by howing the average value or each category. ead_csv() is a function 1 Python's Pandas library</pre>
read_csv()	df = pd.read_csv('file_path.csv')	sed for reading data from Comma-Separated /alues (CSV) file and bading it into a Pandas DataFrame. It's a common nethod for working with abular data stored in CSV ormat Copied!
to_sql()	df.to_sql('table_name', index=False)	<pre>f.to_sql() is a method h Pandas, a Python data hanipulation library used write the contents of a bataFrame to a SQL atabase. It allows to take ata from a DataFrame nd store it structurally vithin a SQL database ble.</pre> l. 1
read_sql()	df = pd.read_sql(sql_query, conn)	ead_sql() is a function rovided by the Pandasbrary in Python for xecuting SQL queriesin retrieving the resultsnt a DataFrame from an QL database. It's a onvenient way to ntegrate SQL databaseCopied!Copied!Copied!
Db2		
Торіс	Syntax	DescriptionExampleibm_db.connect() is a1.1Python function provided1.1by the ibm_db library,2.2which is used for3.3
connect()	<pre>conn = ibm_db.connect('DATABASE=db HOST=hostname;PORT=port;UID PWD=password;', '', '')</pre>	<pre>winch is used for establishing a connection isername; isername; bb 2 Warehouse database. It's commonly used in applications that need to interact with IBM Db2 databases fram Dirthun </pre> 4. 4 1. import ibm_db 2. conn = ibm_db.connect('DATABASE=mydb; 3. HOST=example.com;PORT=50000;UID=myuser; 4. PWD=mypassword;', '', '') Copied!
server_info()	ibm_db.server_info()	databases from Python.ibm_db.server_info(conn)is a Python function2. 2provided by the ibm_db3. 3library, which is used toretrieve information aboutthe IBM Db2 server towhich you are connected.

4. print ("DB_NAME: ", server.DB_NAME)

			Copied!
close()	con.close()	con.close() is a method used to close the connection to a db2 database. When called, it terminates the connection, releasing any associated resources and ensuring the connection is no longer active. This is important for managing database connections efficiently and preventing resource leaks in your db2 database interactions.	1. 1 1. con.close() Copied!
exec_immediate(<pre>sql_statement = "SQL statement goes here")stmt = ibm_db.exec_immediate(conn, sql_statement)</pre>	<pre>ibm_db.exec_immediate() is a Python function provided by the ibm_db library, which is used to execute an SQL statement immediately without the need to prepare or bind it. It's commonly used for executing SQL statements that don't require input parameters or don't need to be prepared in advance.</pre>	<pre>1. 1 2. 2 3. 3 1. # Lets first drop the table INSTRUCTOR in case it exists from a p 2. dropQuery = "drop table INSTRUCTOR" 3. dropStmt = ibm_db.exec_immediate(conn, dropQuery) Copied!</pre>
